Builds a configurable infostealer as a Windows Portable Executable (PE) file or a Python script. The feature has not yet been advertised on the actor's Telegram channel, and there are likely many edge cases that make it unstable and potentially expensive. The feature aims to obtain system information, such as new user accounts being added and deletion of an account. It queries the length of the response from OpenAI or the patched result when the patch argument is equal to 0, or not given. Predator has 106 references to AWS Features, which can be exploited for malicious purposes.

This class contains configuration variables to build an infostealer. On October 16, 2023, the project developer posted a video about Predator that shows the Stealer build process. A user asked if the resulting executable is fully undetectable, to which the developer replied, "Of course." The author included several conditions to handle a user query about the nature of the chat utility, along with a video about Predator that shows the Stealer build process.

This function queries the TOA, TwilioChecker, and Result/TwilioChecker/result.txt for the presence of the string "Predator AI". If these features were fully implemented, the attacker could use them to perform the following when they have valid access:

- **Chat Event Monitoring:** The script parses the input for the presence of Turns for the AWS SES environment. This function takes one argument, `ai_backend`, and returns the result for handling via the Tkinter UI.

The Predator AI developer implemented a ChatGPT-driven class into the Python script, which is designed to make the tool easier to use and to serve as a single text-driven interface between disparate features. The Predator AI is advertised through Telegram channels related to hacking. The main purpose of Predator is to facilitate and make it easier to automate data enrichment and add context to scanner results. The Predator AI is a small step towards a fully automated, user-friendly tool that ultimately was more hype than the tool could deliver. Predator AI is a small step towards a fully automated, user-friendly tool that ultimately was more hype than the tool could deliver.
